

Data Analysis and Visualization Course Project

Project Title: E-commerce Website User Logs Analysis

Project Introduction :

This project focuses on analyzing user logs data from an e-commerce website. This website records data that includes information about user behavior (IP addresses) while browsing the site, such as pages visited, session duration, number of interactions, site navigation paths, language used to access the site, and the value of sales made through that IP addresses

Included Columns :

The database contains 15 columns ,Time and duration of website access, country, language, platform accessed, number of bytes used, IP address of the user who accessed the website, and the value of sales or returns for that user

Project Idea :

Analyzing the data logs of an e-commerce website to: study user behavior within the site, identify the most visited pages, analyze session duration, track website navigation paths, measure content interaction levels, and visualize the data using interactive dashboards and .graphs
